Requirement

NPS, NER Supply MABO required rehabilitation of an asphalt tennis court at the Eleanor Roosevelt National Historic Site (ELRO) Hyde Park, NY. The tennis court area was about 4,000 square feet. Tennis court was constructed in 1950, the court had a 2-inch thick asphalt surface over a 6-inch compacted gravel base.

Challenges

- The material needed to be tested and accepted by National Park Service. Project setting was a national historic site, which was open to the public. Green Dream had to ensure safe conditions by limiting public access through fencing, barricades or other means.
- There was a miscalculation about the area in the original solicitation but Green Dream completed the job and reported the difference between the reality and the numbers in the solicitation.

Result

- GDI assigned a team of experts to remove the old asphalt, power clean the court and repave.
- GDI completed the job much sooner than government estimation.
- GDI kept a systematic and close communication with the teams and controlled the paving.
- Project was satisfactorily completed on time.

Key Factors Contributing to the Success

• *Persistency*

Persistency is one of the main characteristics of GDI staff. They don't get tired and keep working till they reach the result.

• *Quality Control*

Green dream was committed to supply the required specification at all costs. So it took every measure to search and find the best material available in the area and finally did achieve the goal.

• *Management*

The key element of success in this project was close and momentary control over all aspects including time, quality, probabilities, possible delays and ... We did not fear to face the problems. Instead we had the determination to solve them.
